# Charm Decays at B Factories

Brian Meadows  
University of Cincinnati

# Outline

- Charm Decays at B Factories:
  - (Semi-) Leptonic and rare decays – *P. Jackson*
  - D Mixing – *A. Rahimi*
  - Dalitz Plots – *M. Papagallo*
  - Charm Baryons – *R. Chistov*
  - Charmonium and other spectroscopy – *S. Olsen, A. Palano, B. Yabsley, P. Pakhlov*
  - Tau Physics – *G. Lafferty*
  
- Here - *Choice of some results (probably) not covered in above:*
  - Charm Baryons (mostly from BaBar)
  - Charm Mesons – a few items
  
- Summary

# BaBar and Belle

The BaBar Detector

Peak luminosity  $1.08 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$   
 Integrated luminosity  $363 \text{ fb}^{-1}$

BELLE Detector

Peak luminosity  $1.62 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$   
 Integrated luminosity  $602 \text{ fb}^{-1}$

- Main purpose: Study CP violation in asymmetric  $e^+e^- \rightarrow \Upsilon(4S) \rightarrow B\bar{B}$ 
  - Both experiments have far exceeded their design goals
  - Approx.  $1 \text{ ab}^{-1}$  integrated flux combined

# Charm Hadrons at “Factories?”

- Cross sections are large

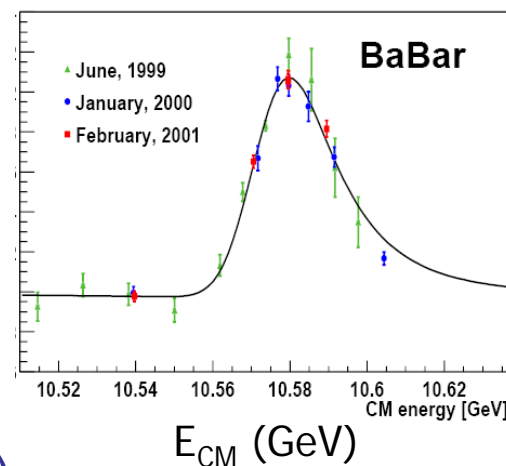

$e^+e^- \rightarrow$	$\sigma$
$b\bar{b}$	1.05 nb
$c\bar{c}$	1.30 nb
$s\bar{s}$	0.35 nb
$u\bar{u}$	1.39 nb
$d\bar{d}$	0.35 nb

- Very high statistics ( $\sim 1.4 \times 10^6$   $D$ 's / fb $^{-1}$ ).

- Also

- Relatively small combinatorial backgrounds in  $e^+e^-$  interactions.
- Good particle ID.
- Detection of all possible final states including neutrals.
- Good tracking and vertexing

Can use “off peak” data

# Charm Baryons

# Charm Baryon States

BUT - No  $J^P$  are yet measured !

□  $|C| = 1$ :

□  $L=0$  Ground State – almost full:

$J^P=1/2^+$ :  $\{6\}_{qq}$

$\Sigma_c(2455), \Xi_c(2470), \Omega_c(2698)$  All seen

$J^P=1/2^+$ :  $\{\bar{3}\}_{qq}$

$\Lambda_c(2285), \Xi_c(2575)$  All seen

$J^P=3/2^+$ :  $\{6\}_{qq}$

$\Sigma_c(2520), \Xi_c(2645), ??$  All but  $\Omega_c^*$

□  $L>1$  – filling up ?

$J^P=1/2^-$ :  $-\Lambda_c(2593), \Xi_c(2790), \dots$

... from CLEO 2

$J^P=3/2^-$ :  $-\Lambda_c(2625), \Xi_c(2815), \dots$

$\Lambda(\text{or } \Sigma)_c(2880), \Lambda(\text{or } \Sigma)_c(2765) ??$

□ Several more new states from BaBar and Belle ... and more

# First Charm Baryon $\rightarrow$ Charm Meson $\Lambda_c(2940)$

- Observed in  $c\bar{c}$  continuum production in  $D^0 p$  decay mode  
 $(D^0 \rightarrow K^-\pi^+, K^-\pi^+\pi^-\pi^+)$

$\Lambda_c(2940)^+$ :

$$M = (2939.8 \pm 1.3 \pm 1.0) \text{ MeV}/c^2$$

$$\Gamma = (17.5 \pm 5.2 \pm 5.9) \text{ MeV}$$

New data on  $\Lambda_c(2880)^+$ :

New Decay Mode  $\rightarrow D^0 p$

BaBar:

$$M = (2881.9 \pm 0.1 \pm 0.5) \text{ MeV}/c^2$$

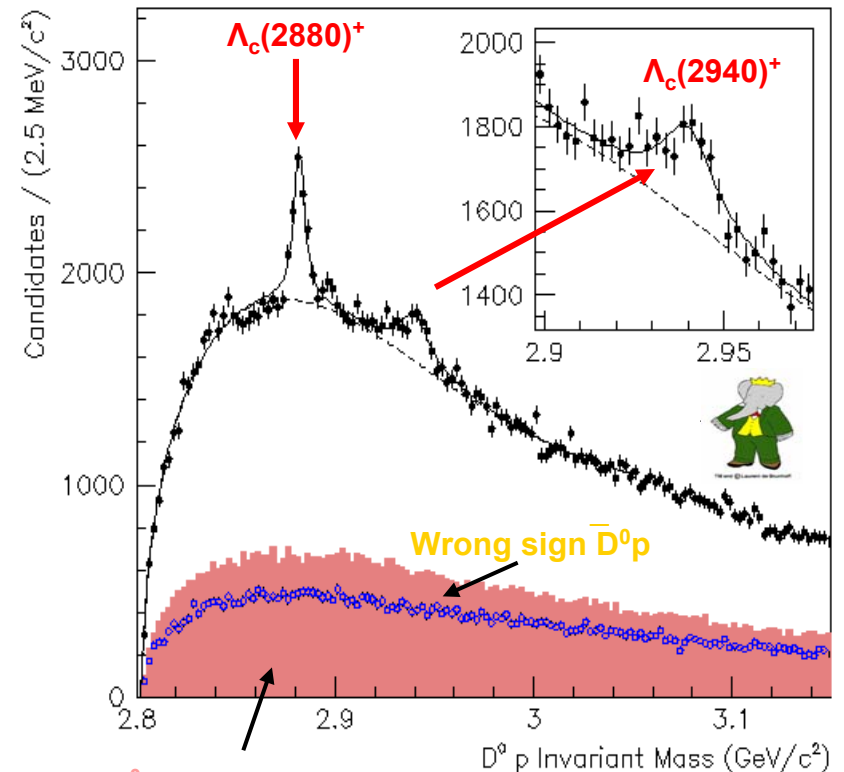

$$\Gamma = (5.8 \pm 1.5 \pm 1.1) \text{ MeV}$$

PDG: ("Could be  $\Sigma_c$ ")

$$M = (2880.9 \pm 2.3) \text{ MeV}/c^2 ; \Gamma < 8 \text{ MeV}$$

287 fb<sup>-1</sup> hep-ex/0603052

$D^0$  mass sidebands

# New Baryon $\Lambda_c(2940)$

- Neither  $\Lambda_c(2940)$  nor  $\Lambda_c(2880)$  seen in  $D^+p$  system

→ Neither are  $\Sigma_c$ 's

Other observations:

Why not seen in  $\Lambda_c\pi^+\pi^-$  or  $\Sigma_c\pi$  ?

Three states predicted near this mass  $3/2^-, 1/2^+, 1/2^-$

$\Lambda_c(2940)$  is 6 MeV/c<sup>2</sup> below  $D^*p$  threshold

$\Lambda_c(2940)$  is  $\pi$  mass above  $\Lambda_c(2880)$

# Search for $\Xi_{cc}$ States

**95% C.L. limits:**

$$\mathcal{B}(\Xi_c^0 \rightarrow \Xi^- \pi^+) \times \dots$$

$$\dots \sigma(e^+e^- \rightarrow \Xi_{cc}^+ X) \times \mathcal{B}(\Xi_{cc}^+ \rightarrow \Xi_c^0 \pi^+) < 2.0 \text{ fb } (p^* > 0 \text{ GeV}/c)$$

$$\dots \sigma(e^+e^- \rightarrow \Xi_{cc}^+ X) \times \mathcal{B}(\Xi_{cc}^+ \rightarrow \Xi_c^0 \pi^+) < 1.3 \text{ fb } (p^* > 2 \text{ GeV}/c)$$

$$\dots \sigma(e^+e^- \rightarrow \Xi_{cc}^+ X) \times \mathcal{B}(\Xi_{cc}^{++} \rightarrow \Xi_c^0 \pi^+ \pi^+) < 5.6 \text{ fb } (p^* > 0 \text{ GeV}/c)$$

$$\dots \sigma(e^+e^- \rightarrow \Xi_{cc}^+ X) \times \mathcal{B}(\Xi_{cc}^{++} \rightarrow \Xi_c^0 \pi^+ \pi^+) < 3.4 \text{ fb } (p^* > 2 \text{ GeV}/c)$$

# Search for $\Xi_{cc}$ States

- Belle also found no evidence for the state seen by SELEX using an even larger sample.

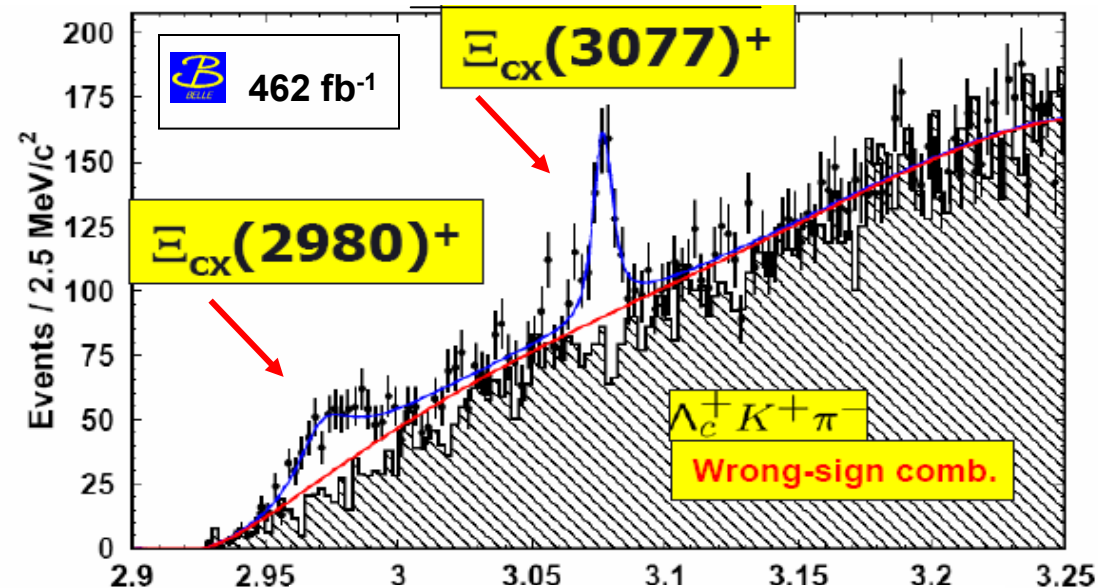

# Observation of Two New $\Xi_c(csu)$ States in cc Continuum Production

While searching for weak decay of

Found strong decays of new  $\Xi_c^*$  's instead:

No structure in  $\Lambda_c^+$  sidebands

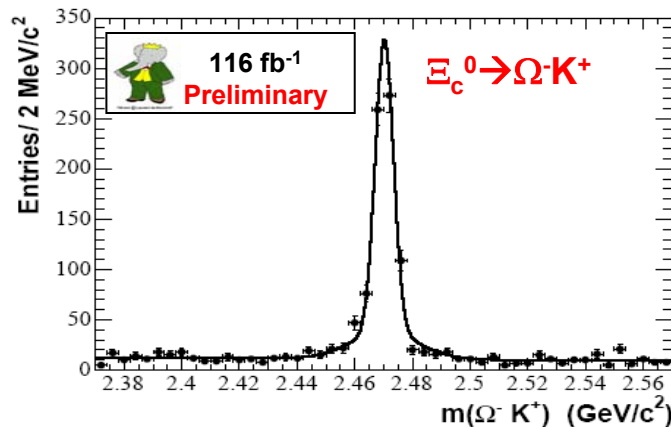

Nor in  $\Lambda_c^+ K^+ \pi^-$  or  $\Lambda_c^+ K^- \pi^-$  wrong sign combinations.

**Belle** 462 fb<sup>-1</sup> **PRELIMINARY**

New State	Mass, (MeV/c <sup>2</sup> )	Width, (MeV/c <sup>2</sup> )	Yield, (events)	Significance, ( $\sigma$ )
$\Xi_{cx}(2980)^+$	$2978.5 \pm 2.1 \pm 2.0$	$43.5 \pm 7.5 \pm 7.0$	$405.3 \pm 50.7$	6.3
$\Xi_{cx}(3077)^+$	$3076.7 \pm 0.9 \pm 0.5$	$6.2 \pm 1.2 \pm 0.8$	$326.0 \pm 39.6$	9.7

# The Spin of The $\Omega^-$

- The existence of large samples of charm baryons makes possible what was once incredibly difficult !

Earlier results from bubble chambers using small, unaligned samples of  $\Omega^-$  could only conclude that  $J > 1/2$ .

Assume the spin of charmed parent is  $1/2$ :

In the charm hyperon rest frame, the  $\Omega^-$  is produced with helicity  $1/2$

independent of the  $\Omega^-$  spin  $J$ .

# The Spin of The $\Omega^-$

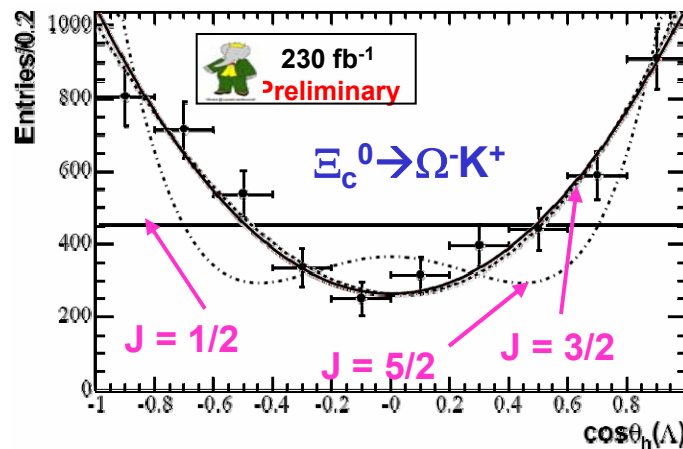

- The  $\Omega^- \rightarrow \Lambda K^-$  decay distribution in its “helicity frame” is then

$$I \propto \sum_{\lambda_i, \lambda_f} \rho_i \left| A_{\lambda_f}^J D_{\lambda_i \lambda_f}^{J*}(\phi, \theta_h, 0) \right|^2$$

$\rho_i$  (is density matrix)

$\lambda_i, \lambda_f$  are initial and final helicities

$J_\Omega$	Fit $\chi^2/\text{NDF}$	Fit probability	Comment
1/2	100.4/9	$1 \times 10^{-17}$	Fig. 4, solid line
3/2	6.5/9	0.69 ( $\beta = 0$ )	Fig. 3, solid curve
3/2	6.1/8	0.64 ( $\beta \neq 0$ )	Fig. 3, dashed curve
5/2	47.6/9	$3 \times 10^{-7}$	Fig. 4, dashed curve

→ Conclude  $J = 3/2$  (if charmed parents are  $J=1/2$ ).

# How About Charm Baryons?

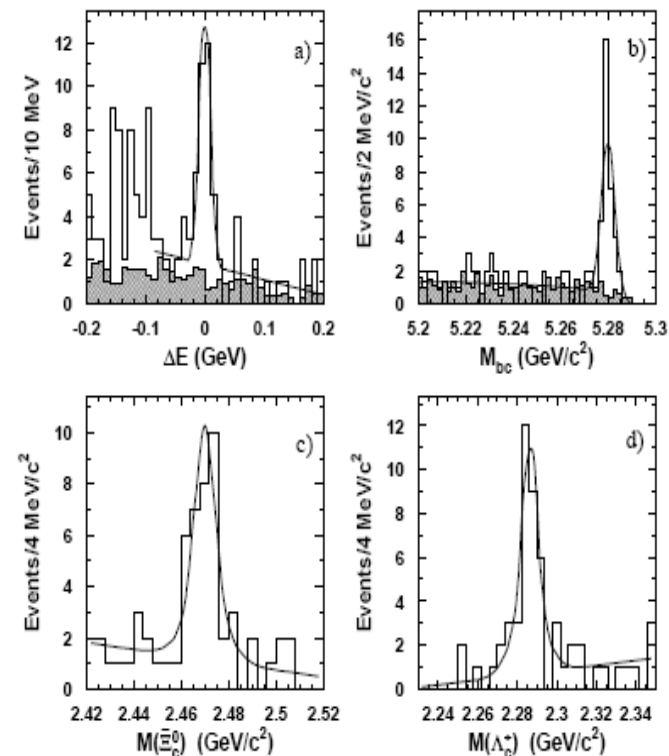

- Information on charm baryon spins could come from decays like

- So far (Belle 357 fb<sup>-1</sup>) only ~12 events where  $\Xi_c^0 \rightarrow \Xi^- \pi^+$

$$\mathcal{B}(B^+ \rightarrow \Lambda_c^+ \bar{\Xi}_c^0) \times \mathcal{B}(\bar{\Xi}_c^0 \rightarrow \bar{\Xi}^- \pi^+)$$

$$= (5.6_{-1.5}^{+1.9} \pm 1.1 \pm 1.5) \times 10^{-5}$$

→ Not promising for determination of  $J$

# Maybe Three- (or more-) Body Decays ?

- 3-body BF's about 10 x 2-body  
 $B^- \rightarrow \Lambda_c^+ \bar{p} \pi^-$  (product of BF's  $\sim 2 \times 10^{-5}$ )  
 have. significant # events:  
 $B^- \rightarrow \Sigma_c^0 \bar{p}$  ( $\Sigma_c^0 \rightarrow \Lambda_c^+ \pi^-$ )
  
- Lots of other things going on
  - Good techniques for dealing with coherent backgrounds may be required.

 140 fb<sup>-1</sup> hep-ex/0409005 (2005)

# Charm Mesons

# Heavy-Light Systems

- Narrow states are easy to find.
- Two wide states are harder.

*Expected by quark models  
To be below  $D^{(*)}K$  threshold*

- Since charm quark is not infinitely heavy, some  $=1/2, 3/2$  mixing can occur between the two  $=1^+$  states.

# Mixing in $J^P = 1^+$ $D_{sJ}(2460)/D_{s1}(2536)$ ?

- Belle has analyzed  $D_{s1}(2536)$  decays to  $D^*K$  to look for an S-wave component.
  - (In the limit the  $c$  quark has infinite mass, the narrow states would decay in pure D-wave)
- Angular distribution of  $\pi^+$  in  $D^{*+}$  system leads to the limits:

$1 + A \cos^2 \gamma$  :

S-wave:  $A=0$

D-wave:  $A=3$

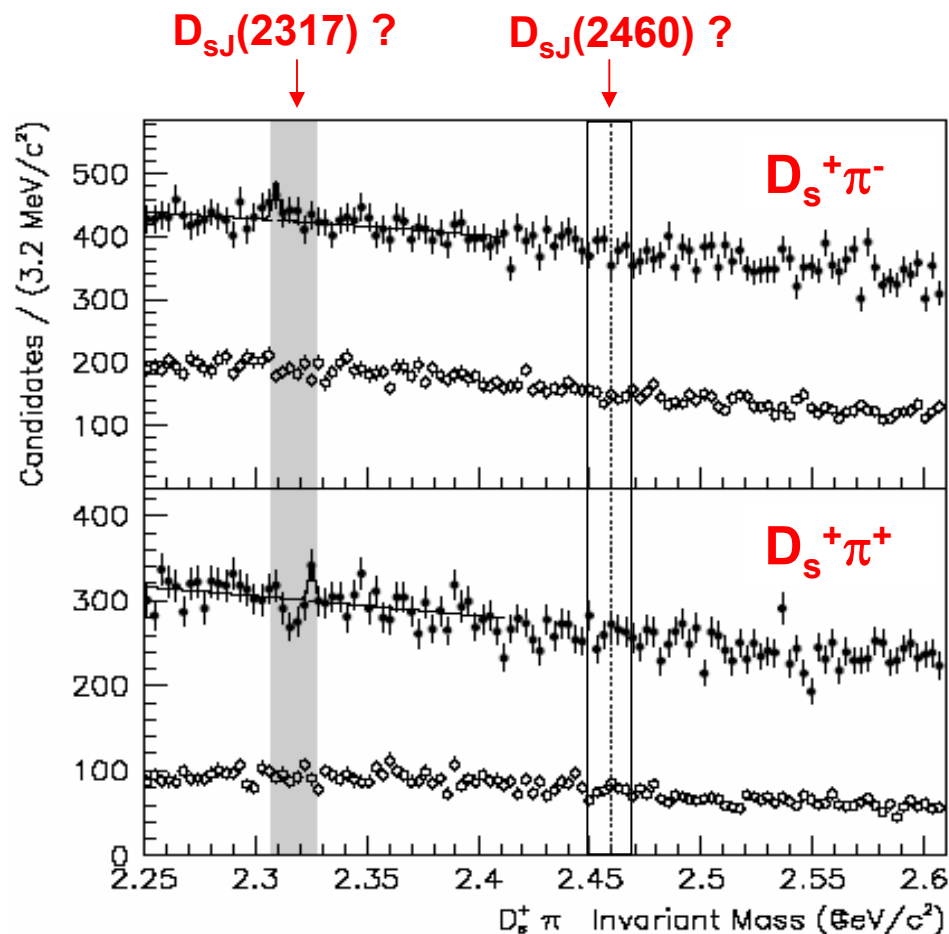

$0.277 < \Gamma_S/(\Gamma_S + \Gamma_D) < 0.955$   
 Indicative of some S-wave

# $D_{sJ}$ 's - Overtly Exotic ?

232 fb<sup>-1</sup> hep-ex/0604030

- No indication of overtly exotic charge states  
Circles are  $D_s$  side-bands
  
- For  $D_{sJ}(2460)$  need to look in  $D_s^{(*)+}\pi^0\pi^{+,-}$  if  $J^P=1^+$
  
- (See Antimo Palano's talk for full details)

# Decays of $B^0 \rightarrow D_s(D_{sJ})^+ + h^-$

- Exotic nature of  $D_{sJ}$  states could show up in

$$R_h = \frac{\mathcal{B}\{B^0 \rightarrow D_s^+ h^-\}}{\mathcal{B}\{B^0 \rightarrow D_{sJ}^+ h^-\}} \quad (h = \pi, K, D)$$

C.-H. Chen, H.-n Li, Phys. Rev. D 69, 054002 (2004)

- $\bar{B}^0 \rightarrow D_{s(J)} K^-$  is especially interesting none of the final state quarks ( $c\bar{u}s\bar{d}$ ) are in the initial  $B(b\bar{d})$  meson.

- Expect  $R_h \sim 1$  for  $c\bar{s}$  and  $R_h \sim 0.1$  for  $c\bar{s}u\bar{u}$

$\bar{B}^0 \rightarrow X + Y$	$X = \{D_s^+ \rightarrow \text{All}\}$	$X = \{D_{sJ}(2317)^+ \rightarrow D_s^+ \pi^0\}$	$X = \{D_{sJ}(2460)^+ \rightarrow D_s^+ \gamma\}$
$h = K^-$	$(3.8 \pm 1.3) \times 10^{-5}$	$(3.3 \pm 0.6 \pm 0.7) \times 10^{-5}$	$(0.4 \pm 0.15^{+0.12}_{-0.11}) \times 10^{-5}$
$h = D^-$	$(8.0 \pm 3.0) \times 10^{-3}$	$(1.1 \pm 0.4) \times 10^{-3}$	$(8.1^{+2.8}_{-2.5}) \times 10^{-4}$

$\rightarrow R_K \sim R_D \sim 1$  (no clear evidence for  $c\bar{s}d\bar{d}$ )

# Doubly Cabibbo Suppressed Decays

First measurement of

$$\frac{\Gamma(D^+ \rightarrow K^+ \pi^0)}{\Gamma(D^+ \rightarrow \text{all})}$$

(CLEO 1990 < 0.04%)

Measured rate relative to

then used average of PDG  
and recent CLEO  
measurement for this rate.

Decays normalized to  $K^- \pi^+ \pi^+$

$$\frac{\mathcal{B}(D^+ \rightarrow \pi^+ \pi^0)}{\mathcal{B}(D^+ \rightarrow K^- \pi^+ \pi^+)} = (13.3 \pm 1.1 \pm 9.0) \times 10^{-3}$$

PDG:  $(13.3 \pm 2.2)$  CLEO-c:  $(13.3 \pm 0.7 \pm 0.6)\%$

$$\rightarrow \frac{\mathcal{B}(D^+ \rightarrow K^+ \pi^0)}{\mathcal{B}(D^+ \rightarrow K^- \pi^+ \pi^+)} = (2.68 \pm 0.50 \pm 0.26) \times 10^{-3}$$

$$\mathcal{B}(D^+ \rightarrow \pi^+ \pi^0) = (12.5 \pm 1.0 \pm 0.8 \pm 0.4) \times 10^{-4}$$

$$\mathcal{B}(D^+ \rightarrow K^+ \pi^0) = (2.52 \pm 0.47 \pm 0.24 \pm 0.08) \times 10^{-4}$$

Uncertainty in  
 $D^+ \rightarrow K^- \pi^+ \pi^+$

# Doubly Cabibbo Suppressed Decays

Naïve, exact SU(3):

$$\frac{\Gamma(D^+ \rightarrow \bar{K}^0 \pi^+)}{\Gamma(D^+ \rightarrow \pi^+ \pi^0)} = 2 \left| \frac{V_{cs}}{V_{cd}} \right|^2$$

BaBar: 2/(1.49 0.29)

□ Also:

$$\frac{\mathcal{B}(D^+ \rightarrow K^+ \pi^0) \tau_{D^0}}{\mathcal{B}(D^0 \rightarrow K^+ \pi^-) \tau_{D^0}} = \frac{1}{2}$$

BaBar: 0.70 0.17

SU(3) predictions are over-simplified:

- First ratio affected by  $K_S$ - $K_L$  interference
- $D^+ \rightarrow K^+ \pi^0$  can also proceed by W-exchange or annihilation diagrams.

→ Measurements are challenging

Results still not well understood.

# Wrong Sign $D^0$ Decays

- Time-integrated rates can be compared with

$$\tan^4 \theta_c = (0.281 \pm 0.006) \times 10^{-2}$$

Despite high backgrounds, measurements at few % level (BaBar tags other side)

	$\frac{\Gamma(D^0 \rightarrow K^+ \pi^-)}{\Gamma(D^0 \rightarrow K^- \pi^+)}$	$\frac{\Gamma(D^0 \rightarrow K^+ \pi^- \pi^0)}{\Gamma(D^0 \rightarrow K^- \pi^+ \pi^0)}$	$\frac{\Gamma(D^0 \rightarrow K^+ \pi^- \pi^+ \pi^-)}{\Gamma(D^0 \rightarrow K^- \pi^+ \pi^- \pi^+)}$
BaBar (%)	—	$0.214 \pm 0.008 \pm 0.008$	—
Belle (%)	—	$0.229 \pm 0.015^{+0.013}_{-0.009}$	$0.320 \pm 0.018^{+0.015}_{-0.013}$
PDG (%)	$0.362 \pm 0.029$	$0.43^{+0.11}_{-0.10} \pm 0.07$	$0.42 \pm 0.13$

- Belle/BaBar agreement excellent
- big improvement over PDG values

229 fb<sup>-1</sup>  
PRELIMINARY

281 fb<sup>-1</sup>  
hep-ex/0507071  
PRELIMINARY

- $D^*$  tagging allows measurement of  $CP$  asymmetries

Belle:  $K^+ 2\pi$  (-0.006 ± 0.053);  $K^+ 3\pi$  (-0.018 ± 0.044)  
consistent with zero.

- any new physics at level much smaller than DCS for “wrong sign” decays.

$K^+ 2\pi \Delta M$  (MeV/c<sup>2</sup>)

$\Delta M$  (MeV/c<sup>2</sup>)

$$\Gamma(D_{(s)}^* \rightarrow D_{(s)}\pi^0) / \Gamma(D_{(s)}^* \rightarrow D_{(s)}\gamma)$$

- *BaBar* has improved measurements of the  $\pi^0/\gamma$  ratios:

Agree with current results  
Fresh input to  $\chi$ PT

90.4 fb<sup>-1</sup> hep-ex/0508039

	BaBar	PDG
$\frac{\Gamma[D_s^{*+}(2117) \rightarrow D_s^+\pi^0]}{\Gamma[D_s^{*+}(2117) \rightarrow D_s^+\gamma]}$	$0.062 \pm 0.005 \pm 0.006$	$0.062^{+0.020}_{-0.018} \pm 0.022$
$\frac{\Gamma[D^{*0}(2007) \rightarrow D^0\pi^0]}{\Gamma[D_s^{*+}(2007) \rightarrow D^0\gamma]}$	$1.74 \pm 0.02 \pm 0.13$	$1.625 \pm 0.20$

# Summary

- *B* Factories provide a very **clean environment** for the production of all charm hadrons
  - new particle paradise !
  - BUT no doubly charmed baryons
- Large (and growing) samples of charm mesons and baryons are likely to complement results from  **$\tau$ -charm** facilities for some time to come
- In several ways, we are learning how information on systems to which charm hadrons, or B mesons, decay can be extracted
- There is a large and enthusiastic community anxious to work on **all aspects of the physics** available.

# Back up Slides

# Precision Measurement of $\Lambda_c$ Mass

hep-ex/0507009 232 fb<sup>-1</sup>

- Important measurement
  - most charm baryon masses measured relative to this
- Method:
  - Choose decay modes with small Q-value/large BR:
    - $\Lambda_c \rightarrow \Lambda K^+ K_s^0$  and  $\Sigma^0 K^+ K_s^0$
  - Estimate / adjust major systematic uncertainties in:
    - Material audit – determine  $\Lambda$  and  $K^0$  mass vs. decay path length
    - Magnetic field – determine  $\Lambda$  and  $K^0$  mass vs. momentum in lab.
- Much larger control samples:
  - $\Lambda_c^+ \rightarrow p K^- \pi^+$        $1.5 \times 10^6$  evs.
  - $\Lambda_c^+ \rightarrow p K^0$        $2.4 \times 10^5$  evs.

# Results

$\Lambda_c \rightarrow \Lambda K^+ K_s^0$	2286.501	0.041 (stat.)	0.144 (syst.)
$\Lambda_c \rightarrow \Sigma^0 K^+ K_s^0$	2286.303	0.181 (stat.)	0.126 (syst.)
$\Lambda_c \rightarrow p K^- \pi^+$	2286.393	0.018 (stat.)	0.447 (syst.)
$\Lambda_c \rightarrow p K_s^0$	2286.361	0.034 (stat.)	0.428 (syst.)

Combined measurement :

$$m(\Lambda_c) = 2286.46 \pm 0.14 \text{ MeV}/c^2$$

- Most precise measurement of charm mass to date
- Approximately 4 x more precise than

Current PDG value: 2284.9 0.6 MeV/c<sup>2</sup>  
and about 2.5  $\sigma$  higher

hep-ex/0507009 232 fb<sup>-1</sup>

# Charm Baryon States

- $L > 1$  – filling up ?
  - $J^P = 1/2^-$ : –  $\Lambda_c(2593)$ ,  $\Xi_c(2790)$ , ...
  - $J^P = 3/2^-$ : –  $\Lambda_c(2625)$ ,  $\Xi_c(2815)$ , ...

- Most massive in PDG 2005 is  $\Xi_c(2815)$

**CLEO 2 has added**  
 **$\Lambda_c(2880)$  and  $\Lambda_c(2765)$**

# New $\Sigma_c$ (2800) Triplet

Could be  $J^P = 3/2^- \Sigma_{c2}$  ??

State	Yield / $10^3$	$\Delta M$ , MeV/ $c^2$	$\Gamma$ , MeV

# B Decays - Absolute Branching Fractions

- $B\bar{B}$  sample with one  $B$  fully reconstructed decays of the other  $B \rightarrow D^{(*)+,0} X$ 
  - Observe  $D_s^+$  and  $D_{sJ}(2460)$  signals in the recoil mass,  $m_X$
- $\rightarrow$  absolute BF's for  $D_s^+$  ( $\rightarrow \phi\pi^+$ ) and for  $D_{sJ}^*(2460)^+$

211 fb<sup>-1</sup> hep-ex/0605036

# $D_{sJ}(2460)^+$ Absolute BFs, cont.

- For the  $D_s^+$  signal:

$$\mathcal{B}(D_s^+ \rightarrow \phi\pi^+) = (4.62 \pm 0.36 \pm 0.50) \%$$

PDG: (4.3 1.2) %

- Combine with previous measurements

113 fb<sup>-1</sup> PRL 93, 181801 (2004)

$$\frac{\mathcal{B}[B \rightarrow D^{(*)} D_{sJ}^*(2460)^+] \times \mathcal{B}[D_{sJ}^*(2460)^+ \rightarrow D_s^+ \gamma]}{\mathcal{B}[B \rightarrow D^{(*)} D_{sJ}^*(2460)^+] \times \mathcal{B}[D_{sJ}^*(2460)^+ \rightarrow D_s^*(2112)^+ \pi^0]} = 0.274 \pm 0.045 \pm 0.020$$

$$(D_s^{*+} \rightarrow D_s^+ \gamma)$$

to obtain absolute BFs:

$$\mathcal{B}[D_{sJ}^*(2460)^+ \rightarrow D_s^*(2112)^+ \pi^0] = (0.56 \pm 0.13 \pm 0.09) \%$$

$$\mathcal{B}[D_{sJ}^*(2460)^+ \rightarrow D_s^+ \gamma] = (0.16 \pm 0.04 \pm 0.03) \%$$

$$\mathcal{B}[D_{sJ}^*(2460)^+ \rightarrow D_s^+ \pi^+ \pi^-] = (0.04 \pm 0.01) \%$$

- Sum of known BFs:  $0.76 \pm 0.20$
